Source Code Pembuatan Bot Telegram

Database yang digunakan

Source Code file mytoken.py

[illegible]

The screenshot shows a PyCharm IDE with a Python script named 'mytoken.py'. The script is designed to interact with a MySQL database. It starts by establishing a connection to a MySQL database named 'db' using the 'mysql.connector' module. A cursor is then used to execute a SQL query: 'select nppd, nama, kelas from tabel_siswa'. The results of the query are fetched using 'datafetchall()' and stored in a variable named 'jmldata'. The script then prints the data to the console. The message handler 'start' is defined to take a command and a message as input. When the 'start' command is received, the script executes the query and prints the results. The console output shows the connection details and the data retrieved from the database. The data is displayed as a list of tuples, each containing a student's NPPD, name, and class.

```

19 @myBot.message_handler(commands=['start', 'help'])
20 def start(message):
21     teks = mytoken.SAPA + "\n-- admin & developer @diansulistiyarini - SMK Taruna Bhakti -- "+" \n \"
22         \"hari ini tanggal \" + str(waktusekarang)
23     myBot.reply_to(message, teks)
24
25 @myBot.message_handler(commands=['datasiswa'])
26 def menu_data_siswa(message):
27     query = \"select nppd, nama, kelas from tabel_siswa\"
28     sql.execute(query)
29     data = sql.fetchall()
30     jmldata = sql.rowcount
31     datacollect = \"
32     if(jmldata>0):
33         #print(data)
34         no = 0
35         for x in data:
36             no += 1
37             datacollect += datacollect + str(x)
38             datacollect += \"\\n\"
39     print(datacollect)
40     myBot.reply_to(message, datacollect)

```

The console output shows the connection details and the data retrieved from the database. The data is displayed as a list of tuples, each containing a student's NPPD, name, and class.
